Information on Our Environmental Policy

Environmental protection is one of the core values of our company and an important part of our corporate governance. All business processes and the actions of every employee have a direct impact on the environment. It is our responsibility to minimise this impact within the scope of what is economically and technically feasible and by means of well-designed processes.

By consistently implementing our environmental policy, we make the best possible contribution to sustainable development and exploit the value creation potential arising from positive economic synergies.

Binding obligations

In our environmental management, we comply with legal and regulatory requirements, other recommendations and environment-related interests. Our aim here is to exceed binding requirements wherever possible and to set the highest possible standards in the area of sustainability.

Low environmental impact

We take proactive measures to prevent harmful environmental impacts of our activities and services. Raw materials and energy are to be used sparingly, and environmental impacts are to be reduced to a minimum. In this context, we also take extensive measures to prevent accidents and limit damage.

Responsible employees

We promote the environmental knowledge and awareness of our employees through continuous training and further education and motivate them to act responsibly, including beyond their work activities.

Environmental management

Managers are obliged to apply the management practices applicable in their area, to continuously review their effectiveness and to adapt them to the latest findings and requirements. A smoothly functioning organisation, advanced management methods and effective information management on the current state of environmental technology form the essential framework.

Synergies and economic efficiency

Our shared responsibility towards people and the environment gives rise to the challenge and the opportunity of reconciling economic efficiency and environmental precaution. In the medium and long term, the continuous improvement of our work processes and their environmental compatibility is a prerequisite for effectively reducing costs while at the same time conserving resources and energy.

Continuous improvement

On the basis of applicable environmental regulations, customer requirements and other specifications, our aim is to improve operational environmental protection and environmental performance systematically and continuously.

Technical development

The environmental impact of new activities, technologies and processes is assessed before they are introduced. Legal and customer requirements represent a minimum criterion in this context. The use of environmentally friendly processes and technologies is being stepped up with the aim of saving resources such as raw materials, energy and water.

Measurability and evaluation

Our corporate responsibility requires the continuous identification, review and evaluation of significant environmental aspects as well as the fulfilment of the defined environmental objectives and programmes on the basis of measurable characteristics.

Technical and organisational processes are subject to constant optimisation in order to prevent and eliminate weaknesses. The impact of current and planned activities on the local environment is regularly monitored and evaluated.

Communication and dialogue

All employees are involved in our environmental management and have the right and the duty to work towards eliminating unnecessary burdens on the environment. Through information and training, we promote environmentally conscious behaviour among our employees inside and outside the company.

We engage in open dialogue with interested parties, customers and authorities on environmental issues and encourage our business partners to implement equivalent environmental guidelines and to actively commit to environmental protection.

Our environmental aspects

- Use of fossil or renewable energy sources
- Energy consumption
- Paper and waste management
- Travel and emissions
- Use and disposal of electrical equipment
- Procurement of operating supplies
- Water use
- Hazardous substances management

Management and all employees are committed to implementing and maintaining this environmental policy.
